

The Study of Relative Efficiency in Growth Curve Model

Nan Chen, Baoguang Tian

Abstract—In this paper, some relative efficiency have been discussed, including the LSE estimate with respect to BLUE in curve model. Four new kinds of relative efficiency have defined, and their upper bounds have been discussed.

Keywords—Relative efficiency, LSE estimate, BLUE estimate, Upper bound, Curve model.

I. INTRODUCTION

CONSIDERING the general growth model

$$\begin{cases} Y = XBZ + e \\ E(e) = 0 \\ Cov(\vec{e}) = V \otimes \Sigma \end{cases} \quad (1)$$

Among them, Y is the $n \times q$ random observation matrix; e is the $n \times q$ random error matrix, X_{nm}, Z_{kq} is the design matrix that we are known, and $r(X) = m, r(Z) = k, B$ is the $p \times k$ regression parameter matrix that we are unknown, V and Σ are positive definite matrices with the size $q \times q$ and $n \times n$ -order respectively. \otimes expresses product of matrix Kronecker. \vec{e} expresses a column vector of the \vec{e} straightened by column.

In the model of (1), there are two more common kinds in the B estimator class [1], [2]: One is the best linear unbiased estimator (BLUE), recorded as:

$$B^* = (X'\Sigma^{-1}X)^{-1} X'\Sigma^{-1}YV^{-1}Z'(ZV^{-1}Z')^{-1}$$

and

$$Cov(B^*) = (ZV^{-1}Z')^{-1} \otimes (X'\Sigma^{-1}X)^{-1}.$$

Another is the least squares estimation (LSE), recorded as:

$$\hat{B} = (X'X)^{-1} X'YZ'(ZV^{-1}Z')^{-1}$$

and

$$Cov(\hat{B}) = (ZZ')^{-1} ZVZ'(ZZ')^{-1} \otimes (X'X)^{-1} X'\Sigma^{-1}X(X'X)^{-1}.$$

Refer to Gauss-Markov theorem: $Cov(B^*) \leq Cov(\hat{B})$.

This study is supported by the Natural Science Foundation of Shandong Province, China (No.ZR2010AL018)

Nan Chen and Baoguang Tian are with Mathematics and Physics College of Qingdao University of Science and Technology, China (e-mail: 601933395@qq.com, tianbaoguangqd@163.com respectively).

It is often used \hat{B} instead of B^* when n is too large or V, Σ is not clear, thus creating a difference. To measure the size of difference, some relative efficiency has been studied of the LSE estimate with respect to BLUE [3]. This paper has defined four new relative efficiencies, and has given their upper bound:

$$\begin{aligned} e_1(\hat{B}/B^*) &= \sum_{i=1}^{m,k} \lambda_i^p [Cov(\hat{B}) - Cov(B^*)] \\ e_2(\hat{B}/B^*) &= \sum_{i=1}^{m,k} \lambda_i^p [P_w \Lambda^2 P_w - (P_w \Lambda^2 P_w)^2] \\ e_3(\hat{B}/B^*) &= \sum_{i=1}^{m,k} \lambda_i^p [Cov(\hat{B}) Cov^{-1}(B^*)] \\ e_4(\hat{B}/B^*) &= \left[\operatorname{tr}[Cov(\hat{B}) Cov^{-1}(B^*)]^p \right]^{\frac{1}{p}} \end{aligned}$$

There $W = Z'X, \Lambda = V \otimes \Sigma, P_w = W(WW)^{-1}W'$, $\lambda_i(A)$ is the i -th order characteristic roots for matrix A from small to large.

II. UPPER BOUND OF $e_1(\hat{B}/B^*)$

Mark:

$$a_i = \lambda_i(V), a_1 \geq \dots \geq a_n \geq 0;$$

$$b_i = \lambda_i(\Sigma), b_1 \geq \dots \geq b_n \geq 0;$$

$$r_i = \lambda_i(X'X), r_1 \geq \dots \geq r_m \geq 0;$$

$$s_i = \lambda_i(X'X), s_1 \geq \dots \geq s_k \geq 0.$$

$$\text{When } q \geq 2k, a_{1i} = (\sqrt{a_i} - \sqrt{a_{q-i+1}})^2, i = 1, 2, \dots, k$$

$$\text{When } q < 2k, a_{1i} = \begin{cases} (\sqrt{a_i} - \sqrt{a_{q-i+1}})^2 & i = 1, 2, \dots, q-k \\ 0 & i = q-k+1, \dots, k \end{cases}$$

$$\text{When } n \geq 2m, a_{2i} = (\sqrt{b_i} - \sqrt{b_{q-i+1}})^2, i = 1, 2, \dots, q-m$$

$$\text{When } n < 2m, a_{2i} = \begin{cases} (\sqrt{b_i} - \sqrt{b_{q-i+1}})^2 & i = 1, 2, \dots, q-m \\ 0 & i = q-m+1, \dots, m \end{cases}$$

Lemma 1: Assume $\Delta = \operatorname{diag}(\delta_1, \dots, \delta_p)$, $\delta_1 > \dots > \delta_p > 0$, $A_{nn} > 0$, where U is an $n \times p$ -column matrix. Then:

$$\min_{U'U=\Delta} \operatorname{tr}(U'AU) = \sum_{i=1}^p \lambda_i(A) \delta_i;$$

$$\min_{U'U=\Delta} \operatorname{tr}(U'AU) = \sum_{i=1}^p \lambda_{n-i+1}(A) \delta_i;$$

$$\max_{U'U=\Delta} \operatorname{tr}(U'AU)^{-1} = \sum_{i=1}^p \lambda_{n-i+1}(A) \delta_{p-i+1}^{-1};$$

$$\max_{U'U=\Delta} \operatorname{tr}(U'AU)^{-1} = \sum_{i=1}^p \lambda_{p-i+1}^{-1}(A) \delta_i^{-1}. [4]$$

Lemma 2: Assume $\mu_i = \lambda_i \left[U' \Lambda U - (U' \Lambda U)^{-1} \right]$, there

$$U_X = X(XX)^{-1}X', \quad \Lambda = \operatorname{diag}(b_1, \dots, b_n), \quad \text{then } \sum_{i=1}^t \mu_i \leq \sum_{i=1}^t r_i,$$

$1 \leq t \leq k$. [5]

Lemma 3: Assume A, B is the $n \times n$ -order non-negative

$$\text{definite matrix, then } \sum_{i=1}^k \lambda_i(AB) \leq \sum_{i=1}^k \lambda_i(A) \sum_{i=1}^k \lambda_i(B). [6]$$

Lemma 4: Assume $X = (x_1, x_2, \dots, x_m)$, $Y = (y_1, y_2, \dots, y_m)$ are two vectors in the space of R^m . And $x_1 \geq \dots \geq x_m$, $y_1 \geq \dots \geq y_m$. I

is a interval in R , $x_1, x_2, \dots, x_m, y_1, y_2, \dots, y_m \in I$, and $\sum_{i=1}^t x_i \leq \sum_{i=1}^t y_i, 1 \leq t \leq m$. If $\phi(x)$ is the monotony but not drop

convex function, then $\sum_{i=1}^m \phi(x_i) \leq \sum_{i=1}^m \phi(y_i)$. This is Advantages

Theorem. [6]

Theorem 1:

$$e_1(\hat{B}/B^*) \leq \sum_{i=1}^{m,k} \left[\left(\frac{a_i b_i}{s_{k-i+1} r_{m-i+1}} \right)^p - \left(\frac{a_{q-k+1} b_{n-m+1}}{s_i r_i} \right)^p \right].$$

Proof: Assume $X = MAN$, $M'M = I_m$, $N'N = NN' = I_m$, where $A = \operatorname{diag}(\sqrt{r_1}, \dots, \sqrt{r_m})$, obtained by Lemma 1:

$$\begin{aligned} \sum_{i=1}^m \lambda_i(X' \Sigma^{-1} X)^{-1} &= \sum_{i=1}^m \lambda_i(N' A M' \Sigma^{-1} M A N)^{-1} \\ &= \sum_{i=1}^m \lambda_i(A M' \Sigma^{-1} M A)^{-1} \geq \sum_{i=1}^m \lambda_{M-I+1}^{-1} (M' \Sigma^{-1} M)^{-1} r_i^{-1} \end{aligned} \quad (2)$$

Obtained by Poincare Theorem [7], [8]:

$$\lambda_{m-i+1}(M' \Sigma^{-1} M) \leq \lambda_{m-i+1}(\Sigma^{-1}) = b_{n-m+i}^{-1} \quad (3)$$

Insert (3) into (2):

$$\sum_{i=1}^m \lambda_i(X' \Sigma^{-1} X) \geq \sum_{i=1}^m b_{n-m+i} r_i^{-1} \quad (4)$$

Then

$$\begin{aligned} &\sum_{i=1}^m \lambda_i((XX)^{-1} X' \Sigma X (XX)^{-1}) \\ &= \sum_{i=1}^m \lambda_i((N' A M' \Sigma^{-1} M A N)^{-1} N' A M' \Sigma M A N (N' A M' \Sigma^{-1} M A N)^{-1}) \\ &= \sum_{i=1}^m \lambda_i(N' A^{-1} M' \Sigma M A^{-1} N) \\ &= \sum_{i=1}^m \lambda_i(A^{-1} M' \Sigma M A^{-1}) \end{aligned}$$

Obtained by Lemma 3:

$$\begin{aligned} &\sum_{i=1}^m \lambda_i(A^{-1} M' \Sigma M A^{-1}) \\ &\leq \sum_{i=1}^m \lambda_i(A^{-2}) \lambda_i(M' \Sigma M) \\ &\leq \sum_{i=1}^m \lambda_i(A^{-2}) \lambda_i(\Sigma) = \sum_{i=1}^m b_i r_{m-i+1}^{-1} \end{aligned} \quad (5)$$

Obtained by Lemma 4 [9]: Assume $\phi(x) = x^p, p \geq 1$, then

$$\sum_{i=1}^m \lambda_i^p(X' \Sigma^{-1} X) \geq \sum_{i=1}^m b_{n-m+i}^p r_i^{-p} \quad (6)$$

$$\sum_{i=1}^m \lambda_i^p((XX)^{-1} X' \Sigma X (XX)^{-1}) \geq \sum_{i=1}^m b_1^p r_{m-i+1}^{-p} \quad (7)$$

By the same token:

$$\sum_{i=1}^k \lambda_i^p(ZV^{-1}Z) \geq \sum_{i=1}^m a_{q-k+i}^p s_i^{-p} \quad (8)$$

$$\sum_{i=1}^k \lambda_i^p((Z'Z)^{-1} Z \Sigma Z' (Z'Z)^{-1}) \geq \sum_{i=1}^m a_1^p s_{k-i+1}^{-p} \quad (9)$$

Insert (6)-(9) into:

$$\begin{aligned} e_1(\hat{B}/B^*) &= \sum_{i=1}^{m,k} \lambda_i^p \left[\operatorname{Cov}(\hat{B}) - \operatorname{Cov}(B^*) \right] \\ &= \sum_{i=1}^{m,k} \lambda_i^p \left[(ZZ')^{-1} ZVZ'(ZZ')^{-1} \otimes (XX)^{-1} X' \Sigma X (XX)^{-1} \right. \\ &\quad \left. - (ZV^{-1}Z') \otimes (X' \Sigma X)^{-1} \right] \\ &= \sum_{i=1}^k \lambda_i^p \left[(ZZ')^{-1} ZVZ'(ZZ')^{-1} \right] \sum_{i=1}^m \lambda_i^p \left[(XX)^{-1} X' \Sigma X (XX)^{-1} \right] \\ &\quad - \sum_{i=1}^k \lambda_i^p \left[(ZV^{-1}Z') \right] \sum_{i=1}^m \lambda_i^p \left[(X' \Sigma X)^{-1} \right] \\ &\leq \sum_{i=1}^{m,k} \left[\left(\frac{a_i b_i}{s_{k-i+1} r_{m-i+1}} \right)^p - \left(\frac{a_{q-k+1} b_{n-m+1}}{s_i r_i} \right)^p \right] \end{aligned}$$

The theorem 1 has been proved.

III. UPPER BOUND OF $e_2(\hat{B}/B^*)$

Mark: $a_i = \lambda_i(V), a_1 \geq \dots \geq a_n \geq 0$;
 $b_i = \lambda_i(\Sigma), b_1 \geq \dots \geq b_n \geq 0$;

Lemma 5: $P_{A \otimes B} = P_A \otimes P_B$. [10]

Lemma 6: Assume $P_X = X(XX)^{-1}X'$, $\Sigma = \operatorname{diag}(b_1, \dots, b_n)$,

$$\omega_i = \lambda_i \left[P_X \Sigma^2 P_X - (P_X \Sigma P_X)^2 \right], \quad \text{then } \sum_{i=1}^m \omega_i^p \leq \sum_{i=1}^{\min(m,n-m)} \beta_i^{2p} \quad (p \geq 1),$$

$\beta_i = \frac{1}{2}(b_i - b_{n-k+1}), i = 1, 2, \dots, \min(m, n-m)$, there X is an $n \times m$ -column matrix of full rank. [11]

$$\text{Theorem 2: } e_2(\hat{B}/B^*) \leq \sum_{i=1}^{\min(m,n-m)} \beta_i^{2p} a_i^{2p} \quad (p \geq 1).$$

Proof: Because $W = Z' \otimes X$. So [12]:

$$\begin{aligned} e_2\left(\hat{B}/B^*\right) &= \sum_{i=1}^{m,k} \lambda_i^p \left[P_W \Lambda^2 P_W - (P_W \Lambda P_W)^2 \right] \\ &= \sum_{i=1}^{m,k} \lambda_i^p \left[P_Z V^2 P_Z \otimes P_X \Sigma^2 P_X - P_Z V P_Z V P_Z (P_Z \Sigma P_X)^2 \right] \\ &= \sum_{i=1}^{m,k} \lambda_i^p \left[P_Z V^2 \otimes (P_X \Sigma^2 P_X - (P_Z \Sigma P_X)^2) \right] \end{aligned}$$

Obtained by Lemma 5:

$$e_2\left(\hat{B}/B^*\right) = \sum_{i=1}^{m,k} \lambda_i^p P_Z V^2 \otimes \sum_{i=1}^{m,k} \lambda_i^p \left[P_X \Sigma^2 P_X - (P_Z \Sigma P_X)^2 \right]$$

Obtained by Lemma 6:

$$e_2\left(\hat{B}/B^*\right) \leq \sum_{i=1}^{\min(m,n-m)} \beta_i^{2p} a_i^{2p} (p \geq 1).$$

IV. UPPER BOUND OF $e_3\left(\hat{B}/B^*\right)$

Mark: $a_i = \lambda_i(V), a_1 \geq \dots \geq a_n \geq 0;$
 $b_i = \lambda_i(\Sigma), b_1 \geq \dots \geq b_n \geq 0;$

When $q \geq 2k$, $a_{ii} = \frac{(a_i - a_{q-i+1})^2}{4a_i a_{q-i+1}}, i = 1, 2, \dots, k$

When $q < 2k$, $a_{ii} = \begin{cases} \frac{(a_i - a_{q-i+1})^2}{4a_i a_{q-i+1}} & i = 1, 2, \dots, k \\ 1 & i = q-k+1, \dots, k \end{cases}$

When $n \geq 2m$, $a_{2i} = \frac{(b_i - b_{n-i+1})^2}{4b_i b_{n-i+1}}, i = 1, 2, \dots, m$

When $n < 2m$, $a_{2i} = \begin{cases} \frac{(b_i - b_{n-i+1})^2}{4b_i b_{n-i+1}} & i = 1, 2, \dots, m \\ 1 & i = n-m+1, \dots, m \end{cases}$

Lemma 7: If $Y_{nl} = X_{nm} \beta_{ml} + \varepsilon$, $Cov(\varepsilon) = \sigma^2 \Sigma > 0$,

$$r(X) = m \leq n, B^* = (X' \Sigma^{-1} X)^{-1} X' \Sigma^{-1} Y, \hat{B} = (X X)^{-1} X Y,$$

$$E(\varepsilon) = 0, \text{ then } \sum_{i=1}^m \lambda_i^p \left[(X X)^{-1} X' \Sigma X (X X)^{-1} (X' \Sigma^{-1} X)^{-1} \right]$$

$$\leq \sum_{i=1}^m a_{2i}^p. [13]$$

Lemma 8: Assume $A_i, i = 1, 2$ is the m rank negative definite square matrix, $D_i, i = 1, 2$ is the n rank negative definite square matrix, then $\lambda_i(A_i \otimes D_i) = \lambda_i(A_i) \otimes \lambda_i(D_i)$, $\lambda_i(A_1 A_2) \leq \lambda_i(A_1) \lambda_i(A_2)$, $i = 1, 2, \dots, m$. [14]

Theorem 3: $e_3\left(\hat{B}/B^*\right) \leq \sum_{i=1}^{m,k} a_{ii}^p a_{2i}^p$

Proof: $e_3\left(\hat{B}/B^*\right) = \sum_{i=1}^{m,k} \lambda_i^p \left[Cov(\hat{B}) Cov^{-1}(B^*) \right]$

$$\begin{aligned} &= \sum_{i=1}^{m,k} \lambda_i^p \left[((ZZ')^{-1} ZVZ'(ZZ')^{-1} \otimes (XX')^{-1} X' \Sigma X (XX)^{-1}) \right. \\ &\quad \left. \left((ZV^{-1} Z')^{-1} \otimes (X' \Sigma^{-1} X)^{-1} \right)^{-1} \right] \\ &= \sum_{i=1}^{m,k} \lambda_i^p \left[((ZZ')^{-1} ZVZ'(ZZ')^{-1} ZV^{-1} Z') \otimes \right. \\ &\quad \left. \left((XX')^{-1} X' \Sigma X (XX)^{-1} X' \Sigma^{-1} X \right) \right] \\ &= \sum_{i=1}^k \lambda_i^p \left[(ZZ')^{-1} ZVZ'(ZZ')^{-1} ZV^{-1} Z' \right] \otimes \\ &\quad \sum_{i=1}^m \lambda_i^p \left[(XX')^{-1} X' \Sigma X (XX)^{-1} X' \Sigma^{-1} X \right] \end{aligned}$$

Obtained by Lemma 7:

$$\begin{aligned} \sum_{i=1}^k \lambda_i^p \left[(ZZ')^{-1} ZVZ'(ZZ')^{-1} ZV^{-1} Z' \right] &\leq \sum_{i=1}^k a_{ii}^p \\ \sum_{i=1}^m \lambda_i^p \left[(XX')^{-1} X' \Sigma X (XX)^{-1} X' \Sigma^{-1} X \right] &\leq \sum_{i=1}^m a_{2i}^p \end{aligned}$$

To sum up: $e_3\left(\hat{B}/B^*\right) \leq \sum_{i=1}^{m,k} a_{ii}^p a_{2i}^p.$

V. UPPER BOUND OF $e_4\left(\hat{B}/B^*\right)$

Mark: $a_i = \lambda_i(V), a_1 \geq \dots \geq a_n \geq 0;$

$$b_i = \lambda_i(\Sigma), b_1 \geq \dots \geq b_n \geq 0;$$

When $q \geq 2k$, $a_{ii} = \frac{(a_i - a_{q-i+1})^2}{4a_i a_{q-i+1}}, i = 1, 2, \dots, k$

When $q < 2k$, $a_{ii} = \begin{cases} \frac{(a_i - a_{q-i+1})^2}{4a_i a_{q-i+1}} & i = 1, 2, \dots, k \\ 1 & i = q-k+1, \dots, k \end{cases}$

When $n \geq 2m$, $a_{2i} = \frac{(b_i - b_{n-i+1})^2}{4b_i b_{n-i+1}}, i = 1, 2, \dots, m$

When $n < 2m$, $a_{2i} = \begin{cases} \frac{(b_i - b_{n-i+1})^2}{4b_i b_{n-i+1}} & i = 1, 2, \dots, m \\ 1 & i = n-m+1, \dots, m \end{cases}$

Lemma 9: Assume $\mu_i = \lambda_i[U' \Lambda U U' \Lambda^{-1} U]$, where U is an $n \times p$ column matrix, and $U' U = I_m$, $\Lambda = diag(b_1, \dots, b_n)$, $b_1 \geq \dots \geq b_n > 0$, then $\sum_{i=1}^l \mu_i \leq \sum_{i=1}^l a_{ii}, t = 1, \dots, k$. [15]

Theorem 4: $e_4\left(\hat{B}/B^*\right) \leq k^{\frac{1}{p}} \left(\sum_{i=1}^m a_{2i}^p \right)^{\frac{1}{p}}.$

Proof:

$$\begin{aligned}
 e_4(\hat{B}/B^*) &= \left[\operatorname{tr} \left[\operatorname{Cov}(\hat{B}) \operatorname{Cov}^{-1}(B^*) \right]^p \right]^{\frac{1}{p}} \\
 &= \left(\operatorname{tr} \left[((ZZ')^{-1} ZVZ'(ZZ')^{-1} \otimes (X'X)^{-1}) \cdot \right. \right. \\
 &\quad \left. \left. ((ZV^{-1}Z') \otimes (X'X)) \right] \right)^{\frac{1}{p}} \\
 &= \left(\operatorname{tr} \left[((ZZ')^{-1} ZVZ'(ZZ')^{-1} (ZV^{-1}Z') \otimes I_m) \right]^p \right)^{\frac{1}{p}} \\
 &= k^{\frac{1}{p}} \left[\operatorname{tr} \left[((ZZ')^{-1} ZVZ'(ZZ')^{-1} (ZV^{-1}Z')) \right]^p \right]^{\frac{1}{p}}
 \end{aligned} \tag{10}$$

By thinking the following:

$$\begin{aligned}
 \operatorname{tr} \left[((ZZ')^{-1} ZVZ'(ZZ')^{-1} (ZV^{-1}Z')) \right]^p = \\
 \sum_{i=1}^m \lambda_i^p \left[((ZZ')^{-1} ZVZ'(ZZ')^{-1} (ZV^{-1}Z')) \right]
 \end{aligned}$$

Because $V > 0$, there is N which is satisfied that $NN' = NN' = I$, $V = N\Lambda N'$, $\Lambda = \operatorname{diag}(b_1, \dots, b_n)$, and let $M =ZN$, $U = M'(MM')^{-\frac{1}{2}}$, $U'U = I_m$, then it is believed that:

$$\begin{aligned}
 &\lambda_i \left[((ZZ')^{-1} ZVZ'(ZZ')^{-1} (ZV^{-1}Z')) \right] \\
 &= \lambda_i \left[(ZNN'Z')^{-1} ZN\Lambda N'Z' (ZNN'Z')^{-1} (Z\Lambda^{-1}Z') \right] \\
 &= \lambda_i \left[(MM')^{-1} MVM' (MM')^{-1} (M\Lambda^{-1}M') \right] \\
 &= \lambda_i (U'\Lambda U U'\Lambda^{-1}U) = \mu_i
 \end{aligned}$$

Obtained by the Lemma 9: $\sum_{i=1}^t \mu_i \leq \sum_{i=1}^t a_{2i}$, $1 \leq t \leq m$. Assume $\varphi(x) = x^p$, $p \geq 1$, there

$$\sum_{i=1}^m \mu_i^p \leq \sum_{i=1}^m a_{2i}^p \tag{11}$$

Insert (11) into (10): $e_4(\hat{B}/B^*) \leq k^{\frac{1}{p}} \left(\sum_{i=1}^m a_{2i}^p \right)^{\frac{1}{p}}$. The Theorem 4 has been proved.
