

Use of Recycled PVB as a Protection against Carbonation

Authors : Michael Tupý, Vít Petránek

Abstract : The paper is focused on testing of the poly(vinyl butyral) (PVB) layer which had the function of a CO₂ insulating protection against concrete and mortar carbonation. The barrier efficiency of PVB was verified by the measurement of diffusion characteristics. Two different types of PVB were tested; original extruded PVB sheet and PVB sheet made from PVB dispersion which was obtained from recycled windshields. The work deals with the testing CO₂ diffusion when polymer sheets were exposed to a CO₂ atmosphere (10% v/v CO₂) with 0% RH. The excellent barrier capability against CO₂ permeability of original and also recycled types of PVB layers was observed. This application of PVB waste can bring advantageous use in civil engineering and significant environmental contribution.

Keywords : windshield, poly(vinyl butyral), mortar, diffusion, carbonatation, polymer waste

Conference Title : ICBSE 2014 : International Conference on Building Science and Engineering

Conference Location : New York, United States

Conference Dates : June 05-06, 2014
