

Synthesis and Characterization of Zeolite/Fe₃O₄ Nanocomposite Material and Investigation of Its Catalytic Reaction

Authors : Mojgan Zendehtdel, Safura Molla Mohammad Zamani

Abstract : In this paper, Fe₃O₄/NaY zeolite nanocomposite with different molar ratio were successfully synthesized and characterized using FT-IR, XRD, TGA, SEM and VSM techniques. The SEM graphs showed that much of Fe₃O₄ was successfully coated by the NaY zeolite layer. Also, the results show that the magnetism of the products is stable with added zeolite. The catalytic effect of nanocomposite investigated for esterification reaction under solvent-free conditions. Hence, the effect of the catalyst amount, reaction time, reaction temperature and reusability of catalyst were considered and nanocomposite that created from zeolite and 16.6 percent of Fe₃O₄ showed the highest yield. The catalyst can be easily separated from reaction with the magnet and it can also be used for several times.

Keywords : zeolite, magnetic, nanocomposite, esterification

Conference Title : ICNN 2014 : International Conference on Nanotechnology and Nanomedicine

Conference Location : Venice, Italy

Conference Dates : August 14-15, 2014
