

Investigation of the Effect of Phosphorous on the Flame Retardant Polyacrylonitrile Nanofiber

Authors : Mustafa Yılmaz, Ahmet Akar, Nesrin Köken, Nilgün Kızılcan

Abstract : Commercially available poly(acrylonitrile-co-vinyl acetate) P(AN-VA) or poly(acrylonitrile-co-methyl acrylate) P(AN-MA) are not satisfactory to meet the demand in flame and fire-resistance. In this work, vinylphosphonic acid is used during polymerization of acrylonitrile, vinyl acetate, methacrylic acid to produce fire-retardant polymers. These phosphorus containing polymers are successfully spun in the form of nanofibers. Properties such as water absorption of polymers are also determined and compared with commercial polymers.

Keywords : flame retardant, nanofiber, polyacrylonitrile, phosphorous compound, membrane

Conference Title : ICFRPA 2018 : International Conference on Flame-Retardant Polymers and their Applications

Conference Location : Dublin, Ireland

Conference Dates : December 20-21, 2018
