

Graphical User Interface Testing by Using Deep Learning

Authors : Akshat Mathur, Sunil Kumar Khatri

Abstract : This paper presents brief about how the use of Artificial intelligence in respect to GUI testing can reduce workload by using DL-fueled method. This paper also discusses about how graphical user interface and event driven software testing can derive benefits from the use of AI techniques. The use of AI techniques not only reduces the task and work load but also helps in getting better output than manual testing. Although results are same, but the use of Artificial intelligence techniques for GUI testing has proven to provide ideal results. DL-fueled framework helped us to find imperfections of the entire webpage and provides test failure result in a score format between 0 and 1 which signifies that are test meets it quality criteria or not. This paper proposes DL-fueled method which helps us to find the genuine GUI bugs and defects and also helped us to scale the existing labour-intensive and skill-intensive methodologies.

Keywords : graphical user interface, GUI, artificial intelligence, deep learning, ML technology

Conference Title : ICAI 2018 : International Conference on Artificial Intelligence for Industries

Conference Location : Dubai, United Arab Emirates

Conference Dates : December 20-21, 2018
