

## Asymmetric Synthesis of $\beta$ - and $\gamma$ -Borylated Amines via Rh-Catalyzed Hydroboration of Allylamine Derivatives

**Authors :** Rukshani Wickrama-Arachchi, Tanner Metz, James M. Takacs

**Abstract :** Amines bearing  $\gamma$ -stereocenters are important structural motifs found in many biologically active compounds. Regioselective Rh-catalyzed asymmetric hydroboration of acyclic allylamines is used to synthesize amines bearing chiral  $\beta$ - and  $\gamma$ -boronic esters yields up to 70% with 98:2 enantioselectivity. The major enantiomeric outcome can be independent of starting alkene geometry, revealing that cis/trans-isomerization of alkene can occur before hydroboration. Stereospecific transformations of the newly generated C-B bond illustrates the utility of these chiral synthons.
