

Curating Pluralistic Futures: Leveling up for Whole-Systems Change

Authors : Daniel Schimmelpfennig

Abstract : This paper attempts to delineate the idea to curate the leveling up for whole-systems change. Curation is the act to select, organize, look after, or present information from a professional point of view through expert knowledge. The trans-paradigmatic, trans-contextual, trans-disciplinary, trans-perspective of trans-media futures studies hopes to enable a move from a monochrome intellectual pursuit towards breathing a higher dimensionality. Progressing to the next level to equip actors for whole-systems change is in consideration of the commonly known symptoms of our time as well as in anticipation of future challenges, both a necessity and desirability. Systems of collective intelligence could potentially scale regenerative, adaptive, and anticipatory capacities. How could such a curation then be enacted and implemented, to initiate the process of leveling-up? The suggestion here is to focus on the metasystem transition, the bio-digital fusion, namely, by merging neurosciences, the ontological design of money as our operating system, and our understanding of the billions of years of time-proven permutations in nature, biomimicry, and biological metaphors like symbiogenesis. Evolutionary cybernetics accompanies the process of whole-systems change.

Keywords : bio-digital fusion, evolutionary cybernetics, metasystem transition, symbiogenesis, transmedia futures studies

Conference Title : ICEC 2020 : International Conference on Evolutionary Cybernetics

Conference Location : Sydney, Australia

Conference Dates : August 27-28, 2020
