

## Performance of Fiber Reinforced Self-Compacting Concrete Containing Different Pozzolanic Materials

**Authors :** Ahmed Fathi Mohamed, Nasir Shafiq, Muhd Fadhil Nuruddin, Ali Elheber Ahmed

**Abstract :** Steel fiber adds to Self-Compacting Concrete (SCC) to enhance its properties and achieves the requirement. This research work focuses on the using of different percentage of steel fiber in SCC mixture contains fly ash and microwave incinerator rice husk ash (MIRHA) as supplementary material. Fibers affect several characteristics of SCC in the fresh and the hardened state. To optimize fiber-reinforced self-compacting concrete (FSCC), the possible fiber content of a given mix composition is an essential input parameter. The aim of the research is to study the properties of fiber reinforced self-compacting (FRSCC) and to develop the expert system/computer program of mix proportion for calculating the steel fiber content and pozzolanic replacement that can be applied to investigate the compressive strength of FSCC mix.
