Static Output Feedback Control of a Two-Wheeled Inverted Pendulum Using Sliding Mode Technique

Authors : Yankun Yang, Xinggang Yan, Konstantinos Sirlantzis, Gareth Howells

Abstract : This paper presents a static output feedback sliding mode control method to regulate a two-wheeled inverted pendulum system with considerations of matched and unmatched uncertainties. A sliding surface is designed and the associated sliding motion stability is analysed based on the reduced-order dynamics. A static output sliding mode control law is synthesised to drive the system to the sliding surface and maintain a sliding motion afterwards. The nonlinear bounds on the uncertainties are employed in the stability analysis and control design to improve the robustness. The simulation results demonstrate the effectiveness of the proposed control.

Keywords : two-wheeled inverted pendulum, output feedback sliding mode control, nonlinear systems, robotics

Conference Title: ICRCS 2021: International Conference on Robotics and Control Systems

Conference Location : Montreal, Canada

Conference Dates : August 05-06, 2021
