One Step Synthesis of Molybdenum Carbide Nanoparticles for Efficient Hydrogen Evolution Reaction

Authors : Sanjay Upadhyay, Om Prakash Pandey

Abstract : Hydrogen has been promoted as an alternative source of energy, which is renewable, cost-effective, and naturefriendly. Hydrogen evolution reaction (HER) can be used for mass production of hydrogen at a very low cost through electrochemical water splitting. An active and efficient electrocatalyst is required to perform this reaction. Till date, platinum (Pt) is a stable and efficient electrocatalyst towards HER. But its high cost and low abundance hiders its large scale uses. Molybdenum carbide having a similar electronic structure to platinum can be a great alternative to costly platinum. In this study, pure phase molybdenum carbide (Mo₂C) has been synthesized in a single step. Synthesis temperature and holding time have been optimized to obtain pure phases of Mo₂C. The surface, structural and morphological properties of as-synthesized compounds have been studied. The HER activity of as-synthesized compounds has been explored in detail.

Keywords : capacitance, hydrogen fuel, molybdenum carbide, nanoparticles

Conference Title : ICECS 2021 : International Conference on Energy Conversion and Storage

Conference Location : Istanbul, Türkiye

Conference Dates : October 25-26, 2021
