

On the Rational Roots of the Agnosticism and the Faith

Authors : Lola Rosalia Saavedra Guzman, Plamen Neytchev Netchev

Abstract : In general, agnosticism is perceived as an uncertainty between a well-structured (religious) belief (in some Christian or pagan deity) and its absolute and total absence, often causing the suspicion that an agnostic is an atheist, which is "reinsured" in case if their personal belief is wrong. All of this, along with the prevailing view among the naturalists that science has already demonstrated the inexistence of God, has compelled us to seek the foundation of agnosticism and faith in the contemporary formal human logic, advanced mathematics, and the natural sciences. Along the way, we will find that no natural science can demonstrate the existence of God, nor could it discard it for rational considerations, which show that there is something beyond. After all, it seems that the human intellect is insufficient to respond surely with yes or no to the existence of higher intelligences leaving unconditional faith as the only path to God for Christians and transcendent techniques, for pagan religious beliefs.

Keywords : agnosticism, formal logic, axioms and postulates, Gödel theorems, and logical faults

Conference Title : ICATTS 2022 : International Conference on Academic Theology and Theological Studies

Conference Location : Istanbul, Türkiye

Conference Dates : July 28-29, 2022
