

Enhancing the Dynamic Performance of Grid-Tied Inverters Using Manta Ray Foraging Algorithm

Authors : H. E. Keshta, A. A. Ali

Abstract : Three phase grid-tied inverters are widely employed in micro-grids (MGs) as interphase between DC and AC systems. These inverters are usually controlled through standard decoupled d-q vector control strategy based on proportional integral (PI) controllers. Recently, advanced meta-heuristic optimization techniques have been used instead of deterministic methods to obtain optimum PI controller parameters. This paper provides a comparative study between the performance of the global Porcellio Scaber algorithm (GPSA) based PI controller and Manta Ray foraging optimization (MRFO) based PI controller.

Keywords : micro-grids, optimization techniques, grid-tied inverter control, PI controller

Conference Title : ICITSE 2021 : International Conference on Innovative Technology and Sustainability Engineering

Conference Location : Dubai, United Arab Emirates

Conference Dates : November 08-09, 2021
