

A Machine Learning Approach for Classification of Directional Valve Leakage in the Hydraulic Final Test

Authors : Christian Neunzig, Simon Fahle, Jürgen Schulz, Matthias Möller, Bernd Kuhlenkötter

Abstract : Due to increasing cost pressure in global markets, artificial intelligence is becoming a technology that is decisive for competition. Predictive quality enables machinery and plant manufacturers to ensure product quality by using data-driven forecasts via machine learning models as a decision-making basis for test results. The use of cross-process Bosch production data along the value chain of hydraulic valves is a promising approach to classifying the quality characteristics of workpieces.

Keywords : predictive quality, hydraulics, machine learning, classification, supervised learning

Conference Title : ICDAPMI 2022 : International Conference on Data Analysis, Prediction and Model Identification

Conference Location : London, United Kingdom

Conference Dates : February 15-16, 2022
