A Deep Learning Approach for the Predictive Quality of Directional Valves in the Hydraulic Final Test

Authors : Christian Neunzig, Simon Fahle, Jürgen Schulz, Matthias Möller, Bernd Kuhlenkötter

Abstract : The increasing use of deep learning applications in production is becoming a competitive advantage. Predictive quality enables the assurance of product quality by using data-driven forecasts via machine learning models as a basis for decisions on test results. The use of real Bosch production data along the value chain of hydraulic valves is a promising approach to classifying the leakage of directional valves.

Keywords : artificial neural networks, classification, hydraulics, predictive quality, deep learning

Conference Title : ICFDPHMES 2022 : International Conference on Fault Detection, Prognostics and Health Management for Electromechanical Systems

Conference Location : Rome, Italy **Conference Dates :** February 17-18, 2022
