

TiO₂/PDMS Coating With Minimum Solar Absorption Loss for Passive Daytime Radiative Cooling

Authors : Bhriagu Rishi Mishra, Sreerag Sundaram, Nithin Jo Varghese, Karthik Sasihithlu

Abstract : We have designed a TiO₂/PDMS coating with 94% solar reflection, 96% IR emission, and 81.8 W/m² cooling power for passive daytime radiative cooling using Kubelka Munk theory and CST microwave studio. To reduce solar absorption loss in 0.3-0.39 m wavelength region, a TiO₂ thin film on top of the coating is used. Simulation using Ansys Lumerical shows that for a 20 m thick TiO₂/PDMS coating, a TiO₂ thin film of 84 nm increases the coating's reflectivity by 11% in the solar region.

Keywords : passive daytime radiative cooling, disordered metamaterial, Kubelka Munk theory, solar reflectivity

Conference Title : ICPM 2022 : International Conference on Plasmonic Metamaterials

Conference Location : Stockholm, Sweden

Conference Dates : July 12-13, 2022
