Understanding Attitude about Landscape Preservation in Context of Place Attachment

Authors : Baiju Soren

Abstract : This research investigates village residents' feelings about rural landscapes and their attitudes toward preserving them, as well as the impact of attachment on participation in preserving those environments. To understand these relationships, 100 respondents from Bandudumha village : a tribal village, Mayurbhanj district of Odisha, were interviewed with a set of questionnaires and photographs. This framework is based on the idea that establishing environmental oversight and desire to cooperate in the development and preservation process can help to establish community values and meaning tied to places. As a result, a personal connection to the rural environment will be explored through an examination of place attachment, landscape choice, and the possible conservation value of landscapes to the people who live there. The findings suggest that commitment to a place can lead to unique ideas on collaborative preservation and the creation of truly relevant, socially inclusive landscapes. Furthermore, the data show how emotional ties to locations provide social support and provide insight into people-place relationships.

Keywords : participation in preservation, place attachment, preservation, rural landscape, sense of place

Conference Title : ICRUFLNC 2022 : International Conference on Rural-Urban Fringe, Landscape and Nature Conservation

Conference Location : Tokyo, Japan

Conference Dates : April 25-26, 2022
