Teaching Remotely during COVID-19 Pandemic: Effectiveness and Challenges Faced by Teachers of Remote Teaching Strategies with Autistic Children in the Kingdom of Bahrain-Teachers’ Point of View

Authors: Wid Daghustani, Alison Mackenzie
Abstract: This research aims to understand how teachers of autistic children responded to teaching remotely during the Covid-19 pandemic. Six teachers who work in an autism centre were interviewed in face-to-face, semi-structured interviews in the Kingdom of Bahrain. The interviews focused on three themes, the effectiveness of remote teaching strategies, the types of remote teachings employed, and the impact on student’s educational outcomes. WhatsApp video calls were used to conduct the remote teaching since it was easy for mothers to use. According to all teachers, the unprecedented change was quite challenging for autism and their families, especially the mothers being the primary caretakers. Additionally, the effectiveness of remote teaching mainly depended on the cooperation and the willingness of the mothers and on the behaviour of the autistic child. Overall, teachers have agreed that in comparison to face-to-face teaching, remote teaching was not a very successful experience.
