A Study on Household Food Security and Dietary Diversity in Urban Centers of Thrissur

Authors: Sandra Thomas

Abstract: This study tries to analyse the level of food security and dietary diversity among households of different socioeconomic classes in the urban centers of Thrissur. The study revealed that there is no much difference in purchasing patterns of food articles among the socio-economic classes indicating a very high level of both physical and economic accessibility of food. On analysing the dietary diversity of the households none of the households scored below five and fifty-three per cent of the households scored eleven or twelve indicating higher diversity in diet. It was also found that income and education are the two important factors that influence the level of household food security.

Keywords: food security, dietary diversity, household level, socio-economic classes
