

Effect of Packaging Treatment and Storage Condition on Stability of Low Fat Chicken Burger

Authors : Mohamed Ahmed Kenawi Abdallah

Abstract : Chemical composition, cooking loss, shrinkage value, texture coefficient indices, Feder value, microbial examination, and sensory evaluation were done in order to examine the effect of adding 15% germinated quinoa seeds flour as extender to chicken wings meat to produce low fat chicken burger, packaged in two different packing materials and stored frozen for nine months. The data indicated reduction in the moisture content, crude either extract, and increase in the ash content, pH value, and total acidity for the samples extended by quinoa flour compared with the control one. The data showed that the extended samples with quinoa flour had the lowest values of TBA, cooking loss, and shrinkage value compared with the control ones. The data also revealed that, the sample contained quinoa flour had total bacterial count and psychrophilic bacterial count lower than the control sample. In addition, it has higher evaluation values for overall acceptability than the control one.

Keywords : chicken wings, low fat chicken burger, quinoa flour, vacuum packaging.

Conference Title : ICFMS 2023 : International Conference on Food Manufacturing and Safety

Conference Location : Bangkok, Thailand

Conference Dates : February 06-07, 2023
