

Counterfeit Product Detection Using Block Chain

Authors : Sharanya C. H., Pragathi M., Vathsala R. S., Theja K. V., Yashaswini S.

Abstract : Identifying counterfeit products have become increasingly important in the product manufacturing industries in recent decades. This current ongoing product issue of counterfeiting has an impact on company sales and profits. To address the aforementioned issue, a functional blockchain technology was implemented, which effectively prevents the product from being counterfeited. By utilizing the blockchain technology, consumers are no longer required to rely on third parties to determine the authenticity of the product being purchased. Blockchain is a distributed database that stores data records known as blocks and several databases known as chains across various networks. Counterfeit products are identified using a QR code reader, and the product's QR code is linked to the blockchain management system. It compares the unique code obtained from the customer to the stored unique code to determine whether or not the product is original.

Keywords : blockchain, ethereum, QR code

Conference Title : ICBC 2023 : International Conference on Blockchain and Cryptocurrencies

Conference Location : Cancun, Mexico

Conference Dates : January 30-31, 2023
