

Fuelwood Heating, Felling, Energy Renewing in Total Fueling of Fuelwood, Renewable Technologies

Authors : Adeiza Matthew, Oluwamishola Abubakar

Abstract : In conclusion, Fuelwood is a traditional and renewable source of energy that can have both positive and negative impacts. Adopting sustainable practices for its collection, transportation, and use and investing in renewable technologies can help mitigate the negative effects and provide a clean and reliable source of energy, improve living standards and support economic development. For example, solar energy can be used to generate electricity, heat homes and water, and can even be used for cooking. Wind energy can be used to generate electricity, and geothermal energy can be used for heating and cooling. Biogas can be produced from waste products such as animal manure, sewage, and organic kitchen waste and can be used for cooking and lighting.

Keywords : calorific, BTU, wood moisture content, density of wood

Conference Title : ICWEEI 2023 : International Conference on Wood Energy and Environmental Impacts

Conference Location : Miami, United States

Conference Dates : March 16-17, 2023
