

Exploring the Potential of Replika: An AI Chatbot for Mental Health Support

Authors : Nashwah Alnajjar

Abstract : This research paper provides an overview of Replika, an AI chatbot application that uses natural language processing technology to engage in conversations with users. The app was developed to provide users with a virtual AI friend who can converse with them on various topics, including mental health. This study explores the experiences of Replika users using quantitative research methodology. A survey was conducted with 12 participants to collect data on their demographics, usage patterns, and experiences with the Replika app. The results showed that Replika has the potential to play a role in mental health support and well-being.

Keywords : Replika, chatbot, mental health, artificial intelligence, natural language processing
