

Hypothesis about the Origin of the Lighting

Authors : Igor Kuzminov

Abstract : Till now, the nature of lightning is not established. A hypothesis of the origin of lightning is proposed. The lightning charge is formed by electromagnetic induction. The role of the conductor is performed by the air mass of the cloud. This conductor moves in the Earth's magnetic field. The upper and lower edges of the cloud are the plates of the capacitor. Lightning is a special case of electromagnetic processes in an atmosphere. The category of lightning occurs in the process of accumulation of a charge. The process of accumulation goes constantly, but the charge is not fixed. Naturally, the hypothesis demands the carrying out of additional experiments and official acknowledgement. As the proof of a hypothesis can serve that the maximal lighting activity in an equatorial zone where $\cos\varphi$ it is close to 1. An experiment conducted privately showed that there is a potential difference in the atmosphere at different levels. The probability of applied value development of power installation is great.

Keywords : electromagnetic induction, Earth's magnetic field, plates of the capacitors, charge accumulation

Conference Title : ICL 2023 : International Conference on Lightning

Conference Location : Vienna, Austria

Conference Dates : December 25-26, 2023
