

## Advancing Environmental Justice Through Active Mobility And Green Transport Modes In Urban Areas

**Authors :** Allison A. Roberts

**Abstract :** Urbanization has led to numerous environmental challenges, often disproportionately affecting marginalized communities. This paper explores the critical concept of environmental justice and the urgent need to address environmental disparities in urban areas. It delves into the adverse impacts of rapid urbanization, including pollution and unequal access to resources. The research focuses on the potential impact of two key solutions: active mobility and green transport. By addressing transportation disparities and offering improved access to jobs, education, and services for marginalized communities, these initiatives can bridge socio-environmental gaps where environmental justice and ecological sustainability go hand in hand.
