Abstract : The purpose of study is to assess utility of 18F-FDG PET/CT in patients with breast heteroplasia and possibility of changing the surgery/therapeutic treatment. Among these "under forty-five" candidates for NAC, the prevalence of change in therapeutic approach in comparison with first and second level exams has been: 43.75%, while by 22% among the "over forty-five". The surgical timing according to first-level exams have been deferred in 31.46% cases; PET/CT has led to a change in therapeutic treatment of 48.31% on the previous given; then the addition of MRI has led to a similar variation. For all the total patients, the prevalent choice was found to be the debulking approach by increasing from a prevalence of 12.92% to 15.17%, resulting in a reduction of conservative one. The present study set itself the objective to demonstrate how the FDG PET/CT could improve on breast imaging according to a more appropriate surgery.

Keywords : breast cancer, FDG PET/CT, preoperative staging, surgical approach

Conference Title : ICBC 2015 : International Conference on Bone and Cartilage

Conference Location : London, United Kingdom

Conference Dates : February 16-17, 2015
