

Improving Decision-Making in Multi-Project Environments within Organizational Information Systems Using Blockchain Technology

Authors : Seyed Hossein Iranmanesh, Hassan Nouri, Seyed Reza Iranmanesh

Abstract : In the dynamic and complex landscape of today's business, organizations often face challenges in impactful decision-making across multi-project settings. To efficiently allocate resources, coordinate tasks, and optimize project outcomes, establishing robust decision-making processes is essential. Furthermore, the increasing importance of information systems and their integration within organizational workflows introduces an additional layer of complexity. This research proposes the use of blockchain technology as a suitable solution to enhance decision-making in multi-project environments, particularly within the realm of information systems. The conceptual framework in this study comprises four independent variables and one dependent variable. The identified independent variables for the targeted research include: Blockchain Layer in Integrated Systems, Quality of Generated Information, User Satisfaction with Integrated Systems and Utilization of Integrated Systems. The project's performance, considered as the dependent variable and moderated by organizational policies and procedures, reflects the impact of blockchain technology adoption on organizational effectiveness. The results highlight the significant influence of blockchain implementation on organizational performance.

Keywords : multi-project environments, decision support systems, information systems, blockchain technology, decentralized systems.

Conference Title : ICBC 2024 : International Conference on Blockchain and Cryptocurrencies

Conference Location : Toronto, Canada

Conference Dates : September 19-20, 2024
