

The Importance of Prehistoric Art: Exploring the Homo Sapien as a Pioneer

Authors : Soumaya Gahrsalah Falhi, Houda Kohli Kallel

Abstract : The first groups of hominids appeared ten million years ago in Africa and they congregated several species that had coexisted. Hence, the Homo genus appeared about two million years ago. By time, several species coexisted, succeeded one after another, evolved then disappeared. Yet, the sole surviving species are those of the Homo Sapiens, the species to which we all belong. They brought along the pastoral and agricultural life. They were also the first to use weapons and metal tools as well. The flint which they have notably continued to use, is no longer only chipped but polished. They have also used fire to harden clay and make pottery. However, they were the first to introduce the metals of copper, bronze and iron later. Their arts are above all those where fire intervenes and their era is that known for the most arduous efforts of the inventive activity. These same men, who introduced metals, have in fact established themselves as the creators of a such powerful mechanisms allowing the maneuver of the monstrous blocks making the first monuments of the architecture. Thus, they gave birth to Cave Art.

Keywords : homo sapiens, prehistoric art, cave art, The old stone age (paleolithic Era)

Conference Title : ICCAAH 2024 : International Conference on Classical Archaeology and Ancient History

Conference Location : Osaka, Japan

Conference Dates : October 28-29, 2024
