

Effects of the Treatment by Polypill Combinations vs Identical Monopill Therapies in Patients with Cardiovascular Comorbid Diseases

Authors : Denys Sebov, Viktoriia Korotaieva, Kateryna Markina

Abstract : The clinical advantage of the multipill combination drugs administration (polypill-strategy) over single-component drugs (monopill-strategy) has been established in patients with comorbid arterial hypertension, heart failure, chronic coronary syndrome, diabetes. It was found that polypill-strategy provides better treatment adherence in 33.4% of the patients. It was proven a significant decrease in systolic and diastolic blood pressure, as well as a decrease in dispersion index due to the stability of the blood pressure profile in patients with the polypill-strategy treatment.

Keywords : polypill, arterial hypertension, cardiovascular disease, compliance

Conference Title : ICC 2024 : International Conference on Cardiology and Cardiovascular Medicine

Conference Location : Venice, Italy

Conference Dates : August 15-16, 2024
