

On Definition of Modulus of Deformation of Ground by Laboratory Method

Authors : Olga Giorgishvili

Abstract : The work is mainly concerned with the determination of modulus of deformation by laboratory method. It is known that a modulus of deformation is defining by laboratory and field methods. By laboratory method the modulus of deformation is defined in the compressive devices. Our goal is to conduct experiments by both methods and finally make to interpret the obtained results. In this article is considered the definition by new offered laboratory method of deformation modulus that is closer to the real deformation modulus. Finally, the obtained results gives the possibility to us to raise the issue of change the state norms for determining ground by laboratory method.

Keywords : building, soil mechanic, deformation moulus, compression methods

Conference Title : ICBSE 2015 : International Conference on Building Science and Engineering

Conference Location : Paris, France

Conference Dates : February 23-24, 2015
