

Presentation of International Military Intervention Correlates (IMIC) Database

Authors : Daniil Chernov

Abstract : In the modern world, the number of conventional interstate wars is declining while the number of military interventions is rising. States no longer initiate conflicts by declaring war but actively intervene in existing military confrontations, often using a comparable number of coercive means. According to existing scholarly understanding, the decision to use force in international relations (in any form) is influenced by roughly the same set of factors: the dynamics of domestic political processes, national interests, international law, and ethical considerations. In the database on armed intervention to be presented in the report, the multifactor model of decision-making is developed. The database describes more than 200 different parameters for armed interventions between 1992 and 2022. The report will present the structure of the database, descriptive statistics, and its key advantages over other sources.

Keywords : conflict resolution, international relations, military intervention, database

Conference Title : ICHSPS 2024 : International Conference on Humanities, Social and Political Sciences

Conference Location : Istanbul, Türkiye

Conference Dates : August 15-16, 2024
