

Implementation of a Method of Crater Detection Using Principal Component Analysis in FPGA

Authors : Izuru Nomura, Tatsuya Takino, Yuji Kageyama, Shin Nagata, Hiroyuki Kamata

Abstract : We propose a method of crater detection from the image of the lunar surface captured by the small space probe. We use the principal component analysis (PCA) to detect craters. Nevertheless, considering a severe environment of the space, it is impossible to use generic computer in practice. Accordingly, we have to implement the method in FPGA. This paper compares FPGA and generic computer by the processing time of a method of crater detection using principal component analysis.

Keywords : crater, PCA, eigenvector, strength value, FPGA, processing time

Conference Title : ICAERST 2015 : International Conference on Aerospace Electronics and Remote Sensing Technology

Conference Location : Paris, France

Conference Dates : January 23-24, 2015
