

Global Legislation on Contagious Illnesses

Authors : Hamid Vahidkia

Abstract : The International Health Regulations (IHR), the sole worldwide regulations for managing infectious diseases, have remained largely unchanged since their initial release in 1951. The WHO is currently involved in updating the IHR. This article evaluates WHO's updated IHR draft and suggests enhancements to enhance global health, such as a strong focus on the organization's fundamental public health goals, activities, and crucial services; wide-reaching coverage for various health risks; establishing global monitoring through official and unofficial data networks; setting benchmarks for national public health systems, evaluating results, and ensuring accountability from countries; safeguarding human rights by implementing evidence-based guidelines and just processes; and promoting good governance by embracing fairness, impartiality, and openness. The World Health Organization needs to guarantee that countries follow health regulations and provide ample economic and technical support to less privileged nations. A crucial concern for the global community is how independent nations can collaborate to ensure that global health benefits all individuals, regardless of their economic status.
