

## High-Temperature Corrosion of Aluminized and Chromized Fe-25.8%Cr-19.5%Ni Alloys in N<sub>2</sub>/H<sub>2</sub>S/H<sub>2</sub>O-mixed Gases

**Authors :** Min Jung Kim, Dong Bok Lee

**Abstract :** Alloys of Fe-25.8%Cr-19.5%Ni (SUS310 stainless steel) were either chromized or aluminized via pack cementation, and corroded at 800 oC for 100 h in 1 atm of (0.9448 atm of N<sub>2</sub>+0.031 atm of H<sub>2</sub>O+0.0242 atm of H<sub>2</sub>S)-mixed gases. The chromized layer consisted primarily of Cr<sub>1.36</sub>Fe<sub>0.52</sub> and some Cr<sub>23</sub>C<sub>6</sub>. Its corrosion resulted in the formation of Cr<sub>2</sub>S<sub>3</sub> and some FeS and Fe<sub>5</sub>Ni<sub>4</sub>S<sub>8</sub>. The aluminized coating consisted primarily of FeAl. Its corrosion resulted in the formation of α-Al<sub>2</sub>O<sub>3</sub>, Al<sub>2</sub>S<sub>3</sub>, and Cr<sub>2</sub>S<sub>3</sub>. Aluminizing was more effective than chromizing in increasing the corrosion resistance of the substrate, due mainly to the formation of α-Al<sub>2</sub>O<sub>3</sub>.
