## Design and Implementation of A 10-bit SAR ADC with A Programmable Reference

Authors : Hasmayadi Abdul Majid, Yuzman Yusoff, Noor Shelida Salleh

**Abstract :** This paper presents the development of a single-ended 38.5 kS/s 10-bit programmable reference SAR ADC which is realized in MIMOS's 0.35 µm CMOS process. The design uses a resistive DAC, a dynamic comparator with pre-amplifier and a SAR digital logic to create 10 effective bits ADC. A programmable reference circuitry allows the ADC to operate with different input range from 0.6 V to 2.1 V. A single ended 38.5 kS/s 10-bit programmable reference SAR ADC was proposed and implemented in a 0.35 µm CMOS technology and consumed less than 7.5 mW power with a 3 V supply.

**Keywords :** successive approximation register analog-to-digital converter, SAR ADC, resistive DAC, programmable reference **Conference Title :** ICMNN 2014 : International Conference on Microelectronics, Nanoelectronics and Nanoengineering **Conference Location :** London, United Kingdom

Conference Dates : December 22-23, 2014
