

Future Desert Farming Projects

Authors : Armen Ohan

Abstract : Global warming and climate change have become the main challenges for the continuation of life on planet Earth after the rate of desertification has become at dangerous rates and has caused the extinction of many sorts of species of animals and plantations that were unable to be qualified for climate changes and their consequences, such as the lack of drinking water and food. The idea of rehabilitating the desert and transforming it into a green environment has become an urgent request to restore the original environment to those areas that have turned into deserts.

Keywords : desertification, molecular diffusion of water, greenhouses., lack of drinking water

Conference Title : ICEEE 2026 : International Conference on Ecology, Environment, and Energy

Conference Location : Amsterdam, Netherlands

Conference Dates : May 13-14, 2026
