

An Investigation about Rate Of Evaporation from the Water Surface and LNG Pool

Authors : Farokh Alipour, Ali Falavand, Neda Beit Saeid

Abstract : The calculation of the effect of accidental releases of flammable materials such as LNG requires the use of a suitable consequence model. This study is due to providing a planning advice for developments in the vicinity of LNG sites and other sites handling flammable materials. In this paper, an applicable algorithm that is able to model pool fires on water is presented and applied to estimate pool fire damage zone. This procedure can be used to model pool fires on land and could be helpful in consequence modeling and domino effect zone measurements of flammable materials which is needed in site selection and plant layout.

Keywords : LNG, pool fire, spill, radiation

Conference Title : ICAME 2015 : International Conference on Automotive and Mechanical Engineering

Conference Location : Zurich, Switzerland

Conference Dates : January 13-14, 2015
