

Conservation of Energy in Households in Urban Areas in India

Authors : Aashee Garg, Anusha Agarwal

Abstract : India, as a country is very rich in terms of natural resources however as citizens, we have not respected this fact and have been continuously exploiting nature's gift to mankind. Further as the population is ever increasing, the load on the consumption of resources is unprecedented. This has led to the depletion of natural resources such as coal, oil, gas etc., apart from the pollution it causes. It is time that we shift from use of these conventional resources to more effective new ways of energy generation. We should develop and encourage usage of renewable resources such as wind and solar in households to conserve energy in place of the above mentioned nonrenewable energy sources. This paper deals with the most effective ways in which the households in India can conserve energy thus reducing effect on environment and depletion of limited resources.

Keywords : energy consumption, resources, India, renewable resources and environment
