

## LIFirr with an Indicator of Microbial Activity in Paraffinic Oil

**Authors :** M. P. Casiraghi, C. M. Quintella, P. Almeida

**Abstract :** Paraffinic oils were submitted to microbial action. The microorganisms consisted of bacteria of the genera *Pseudomonas* sp and *Bacillus* lincheniforms. The alterations in interfacial tension were determined using a tensometer and applying the hanging drop technique at room temperature ( $299\text{ K} \pm 275\text{ K}$ ). The alteration in the constitution of the paraffins was evaluated by means of gas chromatography. The microbial activity was observed to reduce interfacial tension by 54 to 78%, as well as consuming the paraffins C19 to C29 and producing paraffins C36 to C44. The LIFirr technique made it possible to determine the microbial action quickly.
