

Wound Healing Dressing and Some Composites Such as Zeolite, TiO₂, Chitosan and PLGA as New Alternative for Melanoma Therapy: A Review

Authors : L. B. Naves, L. Almeida

Abstract : The development of Drugs Delivery System (DDS), has been wildly investigated in the last decades. In this paper, first a general overview of traditional and modern wound dressing is presented. This is followed by a review of what scientist have done in the medical environment, focusing the possibility to develop a new alternative for DDS through transdermal pathway, aiming to treat melanoma skin cancer.

Keywords : cancer therapy, dressing polymers, melanoma, wound healing

Conference Title : ICTE 2015 : International Conference on Textile Engineering

Conference Location : Miami, United States

Conference Dates : March 09-10, 2015
