

Introduction of a Multimodal Intervention for People with Autism: 'ReAttach'

Authors : P. Weerkamp Bartholomeus

Abstract : Autism treatment evaluation is crucial for monitoring the development of an intervention at an early stage. 'ReAttach' is a new intervention based on the principles of attachment and social cognitive training. Practical research suggests promising results on a variety of developmental areas. Five years after the first ReAttach sessions these findings can be extended with qualitative research by means of follow-up interviews. The potential impact of this treatment on daily life functioning and well-being of autistic persons becomes clear.

Keywords : autism, innovation, treatment, social cognitive training
