## Linear MIMO Model Identification Using an Extended Kalman Filter

Authors: Matthew C. Best

**Abstract :** Linear Multi-Input Multi-Output (MIMO) dynamic models can be identified, with no a priori knowledge of model structure or order, using a new Generalised Identifying Filter (GIF). Based on an Extended Kalman Filter, the new filter identifies the model iteratively, in a continuous modal canonical form, using only input and output time histories. The filter's self-propagating state error covariance matrix allows easy determination of convergence and conditioning, and by progressively increasing model order, the best fitting reduced-order model can be identified. The method is shown to be resistant to noise and can easily be extended to identification of smoothly nonlinear systems.

Keywords: system identification, Kalman filter, linear model, MIMO, model order reduction

Conference Title: ICMICE 2015: International Conference on Modelling, Identification and Control Engineering

**Conference Location :** Prague, Czechia **Conference Dates :** July 09-10, 2015
