

## Carbon Footprint Reduction Using Cleaner Production Strategies in a Otoshimi Producing Plant

**Authors :** Razuana Rahim, Abdul Aziz Abdul Raman

**Abstract :** In this work, a study was conducted to evaluate the feasibility of using Cleaner Production (CP) strategy to reduce carbon dioxide emission (CO<sub>2</sub>) in a plant that produces Otoshimi. CP strategy is meant to reduce CO<sub>2</sub> emission while taking into consideration the economic aspect. For this purpose, a CP audit was conducted and the information obtained were analyzed and major contributors of CO<sub>2</sub> emission inside the boundary of the production plant was identified. Electricity, water and fuel consumption and generation of solid waste and wastewater were identified as the main contributors. Total CO<sub>2</sub> emission generated was 0.27 kg CO<sub>2</sub> per kg of Otoshimi produced, where 68% was contributed by electricity consumption. Subsequently, a total of three CP options were generated and implementations of these options are expected to reduce the CO<sub>2</sub> emission from electricity consumption to 0.16 kg CO<sub>2</sub> per kg of Otoshimi produced, a reduction of about 14%. The study proves that CP strategy can be implemented even without any investment to reduce CO<sub>2</sub> for a plant that produces Otoshimi.
