

Statistical Study and Simulation of 140 Kv X- Ray Tube by Monte Carlo

Authors : Mehdi Homayouni, Karim Adinehvand, Bakhtiar Azadbakht

Abstract : In this study, we used Monte Carlo code (MCNP4C) that is a general method, for simulation, electron source and electric field, a disc source with 0.05 cm radius in direct of anode are used, radius of disc source show focal spot of X-ray tube that here is 0.05 cm. In this simulation, the anode is from tungsten with 18.9 g/cm³ density and angle of the anode is 18°. We simulated X-ray tube for 140 kv. For increasing of speed data acquisition, we use F5 tally. With determination the exact position of F5 tally in the program, outputs are acquired. In this spectrum the start point is about 0.02 Mev, the absorption edges are about 0.06 Mev and 0.07 Mev, and average energy is about 0.05 Mev.

Keywords : X-spectrum, simulation, Monte Carlo, tube

Conference Title : ICMIBE 2015 : International Conference on Medical Informatics and Biomedical Engineering

Conference Location : Osaka, Japan

Conference Dates : October 08-09, 2015
