

## C2N2 Adsorption on the Surface of a BN Nanosheet: A DFT Study

**Authors :** Maziar Noei

**Abstract :** Calculation showed that when the nanosheet is doped by Si, the adsorption energy is about -85.62 to -87.43kcal/mol and also the amount of HOMO/LUMO energy gap ( $E_g$ ) will reduce significantly. Boron nitride nanosheet is a suitable adsorbent for cyanogen and can be used in separation processes cyanogen. It seems that nanosheet (BNNS) is a suitable semiconductor after doping. The doped BNNS in the presence of cyanogens (C<sub>2</sub>N<sub>2</sub>) an electrical signal is generating directly and, therefore, can potentially be used for cyanogen sensors.
