Design of Orientation-Free Handler and Fuzzy Controller for Wire-Driven Heavy Object Lifting System

Authors : Bo-Wei Song, Yun-Jung Lee

Abstract : This paper presents an intention interface and controller for a wire-driven heavy object lifting system that assists the operator with moving a heavy object. The handler is designed to allow a comfortable working posture for the operator. Plus, as a human assistive system, the operator is involved in the control loop, where a fuzzy control system is used to consider the human control characteristics. The effectiveness and performance of the proposed system are proved by experiments. Keywords : fuzzy controller, handler design, heavy object lifting system, human-assistive device, human-in-the-loop system **Conference Title :** ICICSE 2014 : International Conference on Intelligent Control Systems Engineering **Conference Location :** Venice, Italy

Conference Dates : April 14-15, 2014
