Authors : Vinod C. Nayak

Abstract : In day-to-day forensic practice, identification is always a difficult task. Availability of anti-mortem and postmortem records plays a major role in facilitating this tough task. However, the advent of digital forensic is a boon for forensic experts. This study has made use of digital forensics to establish identity by radiological dimensions of maxillary sinus using workstation software. The findings suggest a significant association between maxillary sinus dimensions and human gender. The author will be discussing the methods and results of the study in this e-poster.
