

Processes for Valorization of Valuable Products from Kerf Slurry Waste

Authors : Nadjib Drouiche, Abdenour Lami, Salaheddine Aoudj, Tarik Ouslimane

Abstract : Although solar cells manufacturing is a conservative industry, economics drivers continue to encourage innovation, feedstock savings and cost reduction. Kerf slurry waste is a complex product containing both valuable substances as well as contaminants. The valuable substances are: i) high purity silicon, ii) polyethylene glycol, and iii) silicon carbide. The contaminants mainly include metal fragments and organics. Therefore, recycling of the kerf slurry waste is an important subject not only from the treatment of waste but also from the recovery of valuable products. The present paper relates to processes for the recovery of valuable products from the kerf slurry waste in which they are contained, such products comprising nanoparticles, polyethylene glycol, high purity silicon, and silicon carbide.

Keywords : photovoltaic cell, Kerf slurry waste, recycling, silicon carbide

Conference Title : ICWEEM 2016 : International Conference on Water, Energy and Environmental Management

Conference Location : Madrid, Spain

Conference Dates : March 24-25, 2016
