

## **A Review: Global Crisis Effects on Agriculture and Animal Production in Turkey**

**Authors :** Muhittin Fatih Demirhan, Sibel Alapala Demirhan

**Abstract :** Agriculture, is also regarded as the primary activity area in all economies. When international comparisons are made Turkey has comparative advantages in agricultural potential. However, it is difficult to say that Turkey's agricultural productivity and use of technology is well developed in terms of sufficiency. Turkey, in terms of agricultural production, is one of the rare self-sufficient countries, but for supplying excessive demand of its domestic production to foreign markets to obtain the necessary income it is rather insufficient. On the basis of wrong policies implemented during the crisis and found that bottlenecks in agriculture and animal husbandry or agriculture policies of the IMF and World Bank are imposed on countries like Turkey. The IMF and the World Bank, the reduction of support in the agricultural and livestock Turkey, is known to put pressure for the abolition. Under these circumstances, our farmers, livestock producers and breeders of, not a chance to compete in the same market with EU producers. Animal products that capture the productivity levels of developed countries, seems to be our chance to compete with the quality and hygiene criteria. Thus, the discussion of the issue must be raised as for the sector's contribution to the economy in terms of further increasing production of the existing potential in mobilization.
