

Liquid-Liquid Equilibrium Study in Solvent Extraction of o-Cresol from Coal Tar

Authors : Dewi Selvia Fardhyanti, Astrilia Damayanti

Abstract : Coal tar is a liquid by-product of the process of coal gasification and carbonation, also in some industries such as steel, power plant, cement, and others. This liquid oil mixture contains various kinds of useful compounds such as aromatic compounds and phenolic compounds. These compounds are widely used as raw material for insecticides, dyes, medicines, perfumes, coloring matters, and many others. This research investigates thermodynamic modelling of liquid-liquid equilibria (LLE) in solvent extraction of o-Cresol from the coal tar. The equilibria are modeled by ternary components of Wohl, Van Laar, and Three-Suffix Margules models. The values of the parameters involved are obtained by curve-fitting to the experimental data. Based on the comparison between calculated and experimental data, it turns out that among the three models studied, the Three-Suffix Margules seems to be the best to predict the LLE of o-Cresol for those system.

Keywords : coal tar, o-Cresol, Wohl, Van Laar, three-suffix margules

Conference Title : ICCEPT 2016 : International Conference on Chemical Engineering and Process Technology

Conference Location : Venice, Italy

Conference Dates : August 08-09, 2016
