

Negative Pressures of Ca. -20 MPA for Water Enclosed into a Metal Berthelot Tube under a Vacuum Condition

Authors : K. Hiro, Y. Imai, M. Tanji, H. Deguchi, K. Hatari

Abstract : Negative pressures of liquids have been expected to contribute many kinds of technology. Nevertheless, experiments for subjecting liquids which have not too small volumes to negative pressures are difficult even now. The reason of the difficulties is because the liquids tend to generate cavities easily. In order to remove cavitation nuclei, an apparatus for enclosing water into a metal Berthelot tube under vacuum conditions was developed. By using the apparatus, negative pressures for water rose to ca. -20 MPa. This is the highest value for water in metal Berthelot tubes. Results were explained by a traditional crevice model. **Keywords**

Keywords : Berthelot method, negative pressure, cavitation nuclei, water

Conference Title : ICEFSFS 2016 : International Conference on Experimental Fluid Science and Flow Systems

Conference Location : Tokyo, Japan

Conference Dates : May 26-27, 2016
